The EClamp2378P is a low pass filter array with integrated TVS diodes. It is designed to suppress unwanted EMI/RFI signals and provide electrostatic discharge (ESD) protection in portable electronic equipment. This state-of-the-art device utilizes solid-state silicon-avalanche technology for superior clamping performance and DC electrical characteristics. They have been optimized for protection of color LCD panels in cellular phones and other portable electronics.

The device consists of eight identical circuits comprised of TVS diodes for ESD protection, and a resistor - capacitor network for EMI/RFI filtering. A series resistor value of 100Ω and a capacitance value of 10pF are used to achieve 30dB minimum attenuation from 1.8GHz to 2.5GHz. The TVS diodes provide effective suppression of ESD voltages in excess of ±15kV (air discharge) and ±8kV (contact discharge) per IEC 61000-4-2, level 4.

The EClamp2378P is in a 16-pin, RoHS/WEEE compliant, SLP4016P16 package. It measures 4.0 x 1.6 x 0.58mm. The leads are spaced at a pitch of 0.5mm and are finished with lead-free NiPd. The small package makes it ideal for use in portable electronics such as cell phones, digital still cameras, and PDAs.

**EClamp2378P**

**ESD/EMI Protection for Color LCD Interfaces**

**Features**

- Bidirectional EMI/RFI filter with integrated TVS for ESD protection
- ESD protection to IEC 61000-4-2 (ESD) Level 4, ±15kV (air), ±8kV (contact)
- Filter performance: 30dB minimum attenuation 1.8GHz to 2.5GHz
- TVS working voltage: 5V
- Resistor: 100Ω +/- 15%
- Typical Capacitance: 20pF (VR = 0V)
- Protection and filtering for eight lines
- Solid-state technology

**Mechanical Characteristics**

- SLP4016P16 16-pin package
- RoHS/WEEE Compliant
- Nominal Dimensions: 4.0 x 1.6 x 0.58 mm
- Lead Pitch: 0.5mm
- Lead finish: NiPdAu
- Marking : Marking Code
- Packaging : Tape and Reel

**Applications**

- Color LCD Protection
- Cell Phone CCD Camera Lines
- Clamshell Cell Phones

Device Connection

The EClamp2378P is comprised of eight identical circuits each consisting of a low pass filter for EMI/RFI suppression and dual TVS diodes for ESD protection. The device is in a 16-pin SLP package. Electrical connection is made to the 16 pins located at the bottom of the device. A center tab serves as the ground connection. The device has a flow through design for easy layout. Pin connections are noted in Figure 1. All path lengths should be kept as short as possible to minimize the effects of parasitic inductance in the board traces. Recommendations for the ground connection are given below.

Ground Connection Recommendation

Parasitic inductance present in the board layout will affect the filtering performance of the device. As frequency increases, the effect of the inductance becomes more dominant. This effect is given by Equation 1.

**Equation 1: The Impedance of an Inductor at Frequency XLF**

\[ XLF(L, f) = 2 \pi f L \]

Where:
L = Inductance (H)
f = Frequency (Hz)

Via connections to the ground plane form rectangular wire loops or ground loop inductance as shown in Figure 2. Ground loop inductance can be reduced by using multiple vias to make the connection to the ground plane. Bringing the ground plane closer to the signal layer (preferably the next layer) also reduces ground loop inductance. Multiple vias in the device ground pad will result in a lower inductive ground loop over two exterior vias. Vias with a diameter \( d \) are separated by a distance \( y \) run between layers separated by a distance \( x \). The inductance of the loop path is given by Equation 2. Thus, decreasing distance \( x \) and \( y \) will reduce the loop inductance and result in better high frequency filter characteristics.

**Equation 2: Inductance of Rectangular Wire Loop**

\[ L_{RECT}(d, x, y) = 10.16 \times 10^{-9} \left[ x \ln\left(\frac{2y}{d}\right) + y \ln\left(\frac{2x}{d}\right) \right] \]

Where:
d = Diameter of the wire (in)
x = Length of wire loop (in)
y = Breath of wire loop (in)
Figure 3 shows the recommended device layout. The ground pad vias have a diameter of 0.008 inches (0.20 mm) while the two external vias have a diameter of 0.010 inches (0.250mm). The internal vias are spaced approximately evenly from the center of the pad. The designer may choose to use more vias with a smaller diameter (such as 0.005 inches or 0.125mm) since changing the diameter of the via will result in little change in inductance (i.e. the log function in Equation 2 in highly insensitive to parameter d) . Figure 4 shows a typical insertion loss (S21) plot for the device using Semtech’s filter evaluation board with 50 Ohm traces and the recommended via configuration. Figure 5 shows a typical insertion loss (S21) plot using a similar board without the internal ground pad vias. The result is a more inductive ground loop. Note the “hump” at a frequency of 2.5GHz. This is the resonant frequency of the higher ground loop inductance.
